

**APPENDIX E**  
**(Clean Copy Of Amended Abstract)**

A dustproof and oil leakproof structure of a bearing includes a shaft seat having a bearing provided therein, and a rotation shaft rotatably mounted in the bearing. The characteristic is that an elastic race is formed with a hole such that the race is closely combined on and rotates with the rotation shaft located above the bearing, and a circumferential edge of the race is almost or slightly in contact with the inner wall of the shaft seat.
